Contemporary Model of NDT for Individuals Post-Stroke and Brain Injury

2-Day Introductory Workshop

October 4-5, 2019

This workshop follows the NDT philosophy and its clinical applications for adults post stroke and brain injury. This interdisciplinary course is designed to give participants basic knowledge about NDT and how it is applied in clinical practice to promote recovery of function following neurological damage. The course format will include interactive laboratory sessions, a patient demonstration by the instructor, and group discussions. Information will be presented in a cross-functional manner to incorporate all rehabilitation disciplines and practice settings.

This introductory workshop is suitable for OT, PT, SLP, OTA/PTA, ET, and other hands-on registered professionals working with adults.

The Arm—Leg Connection

NDT Treatment of the Upper & Lower Extremities

2-Day Intermediate Workshop

October 6-7, 2019

The two most requested NDT topics are upper extremity and gait. This 2-day intermediate course will help you streamline your assessment of the upper and lower quadrants to determine the most significant clinical impairments interfering with your clients' function.

This workshop is intended for participants who have previously taken an introductory course and have 3 or more years' experience working with neurologically impaired patients.

The intermediate workshop is intended for therapists with previous NDT training and experience.
